Scientific Background

CRISPR (clustered regularly interspaced short palindromic repeat) and their CRISPR-associated (Cas) proteins constitute the adaptive immune system in bacteria (1-2). This system has been redesigned to create an exemplary genome editing tool for application to RNA-based therapeutics development (3) and disease diagnosis of viral pathogens. Cas12 and Cas13 are recognized as ideal candidates for future development and management of diseases such as cancer (4). Several CRISPR-Cas12 based SARS-CoV-2 detection assays have been developed (5). CRISPR/Cas12 (LbCpf1) is a Cas12 synthetic construct derived from *Lachnospiraceae* bacterium.

Cas12 Activity Assay Protocol

Reaction Components

Active DNA Endonuclease

It is recommended that the researcher perform a serial dilution of Active Cas12 diluted with Endonuclease Buffer for optimal results.

Endonuclease Buffer (5x)

Buffer components: 50 mM Tris-HCl pH8.0, 250 mM NaCl, 50 mM MgCl₂, 0.5 mg/mL BSA.

CRISPR RNA

Single guide RNA containing a custom-designed crRNA fused a scaffold sequence responsible for recruiting the Cas enzyme.

Double-stranded DNA (dsDNA) activator

A dsDNA oligo that contains the complementary sequence to the crRNA and a PAM sequence specific for the Cas enzyme.

Reporter Substrate

A short single-stranded DNA labeled with a fluorophore and a quencher on the two termini.

Assay Protocol

The DNA trans-cleavage activity of Cas12 is detected in a CRISPR-based fluorescent reporter assay. RNA-guided DNA binding to Cas12 activates the enzyme, induces target DNA cutting as well as indiscriminate single-stranded DNA collateral cleavage activity. The latter leads to the degradation of ssDNA reporters that, emits a fluorescent signal on cleavage.

- Step 1.** Thaw the active Cas12 on ice. Prepare 1X Endonuclease Buffer. Equilibrate the buffer, guide RNA, dsDNA activator and FQ-ssDNA substrate to ambient temperature.
- Step 2.** Prepare the following working solutions with 1X Endonuclease Buffer:
 - 4X final concentration of Active Cas12
 - 4X final concentration of guide RNA
 - 2X final concentration of activator/reporter mix containing dsDNA activator and ssDNA reporter.
- Step 3.** In a half-area solid black 96-well plate, add the following components and pre-incubate at room temperature for 10 minutes;
 - Component 1.** 10 µL of 4X Active Cas12
 - Component 2.** 10 µL of 4X guide RNA

Note: A blank control can be set up as outlined in step 4 by replacing the enzyme working solution with an equal volume of the assay buffer.
- Step 4.** To each assay well, add 20 µL of the 2X activator/reporter mix. Shake the plate for 1 minute on a tabletop orbital shaker. Seal the assay wells with a plate sealer and incubate at 37°C for 10-30minutes.
- Step 5.** Equilibrate the plate to ambient temperature and then remove the plate sealer. Read fluorescence on a microplate reader.
